

ANGINA

Angina is chest pain or discomfort caused by reduced blood flow to the heart muscle. It's a common symptom of coronary artery disease and often triggered by physical activity or stress. This chart shows how angina develops, its typical symptoms, and common triggers.

Coronary Artery Disease (CAD)

Atherosclerotic plaque buildup in the coronary arteries limits oxygen supply to the heart muscle, causing angina.

Chest pain can spread to the arms, neck, jaw, or stomach, typical signs of angina or a heart attack.
